

Purple: CB8 in $v = 1 - 2\sqrt{\Delta_\sigma}$ with the short-range series imposed through C_8^{SR} ($K = 8$); GFF series through $C_8(1) = (8.060 \pm 0.017) \times 10^6$.

Blue, left panel: GFF series alone, CB8 (dash-dot) and CB3 (dotted, $C_0, \ldots, C_3$ only). Not drawn: dependence on prescription and on $K = 5$–8, at most 4.67×10^{-3}.

Filled: HT final values, NRG, accepted new MC. Open: HT without continuum value ($N = 40$), NRG not converged in chain depth, new MC with other statuses.

Open NRG ($\Delta_\sigma \geq 0.225$): settled value, no error bar, not used in the comparison. HT dashed bar: one-sided error.

Published MC: quoted errors; in the right panel three of their bars are cut at the frame.
